This notebook configures your library of notebooks to connect to an Azure Machine Learning Workspace. In this case, a library contains all of the notebooks in the current folder and any nested folders. You can configure this notebook to use an existing workspace or create a new workspace.

What is an Azure ML Workspace and why do I need one?

An AML Workspace is an Azure resource that organizes and coordinates the actions of many other Azure resources to assist in executing and sharing machine learning workflows. In particular, an AML Workspace coordinates storage, databases, and compute resources providing added functionality for machine learning experimentation, operationalization, and the monitoring of operationalized models.

Prerequisites

1. Access Azure Subscription

In order to create an AML Workspace, first you need access to an Azure Subscription. You can [create your own](#) or get your existing subscription information from the [Azure portal](#).

2. If you're running on your own local environment, install Azure ML SDK and other libraries

If you are running in your own environment, follow [SDK installation instructions](#). If you are running in Azure Notebooks or another Microsoft managed environment, the SDK is already installed.

Also install following libraries to your environment. Many of the example notebooks depend on them

```
(myenv) $ conda install -y matplotlib tqdm scikit-learn
```

Once installation is complete, check the Azure ML SDK version:

```
In [1]: import azureml.core
print("SDK Version:", azureml.core.VERSION)

SDK Version: 0.1.59
```
